Re: Revenue Intelligence Dashboard — what I need and why

The problem

I spend every Monday morning watching my team copy-paste numbers from three different tools into a slide deck. By the time we're done, the meeting is half over and we still can't answer the questions that actually matter. I need you to fix this.

We have good data. It's just trapped in three places that don't talk to each other:

- **Our CRM** has every deal we've ever worked — who the account is, what product they bought, whether we won or lost, and why.
- **The marketing platform** has campaign performance — which channels we're spending on, which leads responded, and what revenue we can attribute back to campaigns.
- **The support system** has every ticket our customers have ever filed — what broke, how bad it was, how long it took to fix, and how the customer felt about it.

What I can't do today is connect these. I can't look at a campaign and trace it all the way through to a closed deal. I can't look at a high-value account and immediately see whether they're also a high-maintenance account on the support side. I need both.

What I want

A single dashboard with three views. One place the whole revenue team can go instead of three.

View 1: Marketing Funnel

I want to see how our marketing investment turns into pipeline. Specifically:

- **Campaign performance by channel** — which channels (Email, Paid Social, Organic Search, etc.) are actually generating leads that convert?
- **Lead-to-deal conversion rates** — not just "how many leads did we get" but "how many of those leads became qualified, became opportunities, and eventually closed?"
- **Campaign ROI** — we're spending money on six campaigns right now. Which ones are paying for themselves and which ones aren't?
- **Response rates** — what percentage of leads in each campaign actually responded?

I want to be able to filter by campaign name, channel, date range, and customer segment.

View 2: Sales Pipeline

I want to understand our deal flow and revenue performance:

- **Deal stages and outcomes** — how many deals are we winning vs. losing, and what are the primary loss reasons?
- **Revenue by segment and product** — are we making our money from Enterprise accounts buying NovaPulse, or is it coming from somewhere unexpected?
- **Win rates** — overall and broken down by sales region, sales rep, and product.
- **Days to close** — how long does it take us to close a deal from creation to close? Is that getting better or worse?
- **Average deal value** — by product, by segment, by region.

I want to be able to filter by sales region, sales manager, product line, date range, and deal stage.

View 3: Customer Health

This is the one nobody is tracking today and it worries me the most:

- **Support ticket volume by account** — which accounts are filing the most tickets? Are those our biggest revenue accounts?
- **Resolution times** — how long does it take us to resolve tickets? Break it down by priority level.
- **Product area issues** — which parts of our product are generating the most support load? (Analytics Dashboard? Billing? Authentication?)
- **Customer sentiment** — are customers generally positive, neutral, or negative when they reach out?
- **Risk indicators** — I want to see accounts that have high ticket volume, negative sentiment, AND high deal value. Those are the accounts we could lose.

I want to be able to filter by account, priority, product area, customer tier, and region.

Cross-view requirements

- **Filters that work across pages** — if I select "Enterprise" segment on one view, I want the other views to update too.
- **Drill-down** — I should be able to click on a bar in a chart and see the detail behind it.
- **Account-level linking** — the whole point is connecting marketing → sales → support for the same accounts. The `account_id` field exists in all three datasets. Use it.

Natural language access

I also want the team to be able to ask plain-English questions of this data using Quick Chat. Things like:

- "Which campaign source has the highest conversion rate?"
- "What is the average deal size for accounts with more than 3 support tickets in the last 30 days?"
- "Show me all Enterprise accounts with negative customer sentiment."
- "What's our win rate for deals sourced from Partner Referral?"
- "Which product area has the longest average resolution time?"

The dashboard answers the questions we ask every week. The natural-language piece handles the ad-hoc questions we haven't thought of yet.

What I don't need

- I don't need real-time data. Weekly freshness is fine.
- I don't need predictive modeling or forecasting at this stage. Just show me what happened and what's happening now.
- I don't need pixel-perfect printed reports. This is an interactive tool for the revenue team, not a board deck.

Timeline

I'd like a working version within the week. It doesn't need to be perfect — we'll iterate. But I need something the team can start using at next Monday's meeting.
